

SAGE is a repository that houses quality data about child and youth development, health, and well-being.
We provide services that promote good data management, facilitate collaboration, and expedite knowledge translation.

75%

of donors look for information about the non-profit's impact prior to giving¹

970 hours

of a non-profit's time is wasted yearly by managing data that is never analyzed²

#1

motivation for data-driven impact assessment: Funders' requirements

(1) Root Cause, 2013 (2) Stoecker et al., 2004

Why non-profits should reuse data

SAGE has high-quality data that you can use to build on the knowledge of others. Use of existing data enables evidence-based decisions to improve program development and service delivery.

We help build connections between you and researchers or other non-profits that deposit data. Collaboration creates a more holistic understanding of the social issues being addressed, and increases opportunities for collective impact.

The SAGE Analytic Environment provides a cost-efficient solution for accessing a variety of analytic software.

PolicyWise' expertise is also leveraged to support data analytics and knowledge mobilization.

Why non-profits should share data

Let SAGE help you develop strategies to optimize the use of your data.

SAGE helps connect you and your data to researchers. These users can help you identify gaps in service delivery, improve outreach, and help measure your impact. This evidence can increase organizational efficiency and help attract diverse funding.

You can help determine how your data is used so that they align with the mission and values of your organization. Approved users sign a legal agreement that protects client privacy and confidentiality.

We support and build capacity, helping you become more data-informed and active in policy development.

15%

decrease in homelessness in Calgary due, in part, to a shared data initiative³

29%

increase in meals for low-income families in Arkansas as a result of collaborative efforts⁴

31%

reduction in teenage substance abuse in rural Massachusetts through a collaborative, data-driven approach⁵
